1 Introduction

Thinfinity® VirtualUI[™] for FireMonkey® is a solution that enables developers to add user interface web remoting to their FireMonkey applications. Typically adding one line of code to the FireMonkey's project, the application becomes dual-platform, Windows and HTML5. It can be run as usual on a Windows environment, or it can be installed on a Thinfinity® VirtualUI[™] for FireMonkey® Server environment and be accessed remotely from any HTML5 compliant Web Browser.

Why Thinfinity® VirtualUI[™] for FireMonkey®?

- 1. Enables you to effortlessly create dual-platform Windows/HTML5 FireMonkey Apps.
- 2. Expands applications availability by delivering them instantly to users anywhere on any device.
- 3. Reduces dramatically the Total cost of ownership (TCO), by slashing IT costs and simplifying administration avoiding costly virtualization/remoting solutions such as Citrix XenApp® or Microsoft[™] RemoteApp.

2 Architecture

WebFMX is composed by:

- Thinfinity® VirtualUI™ for FireMonkey® Client: HTML5 Web Browser
- Thinfinity® VirtualUI™ for FireMonkey® Server: Windows Service
- Thinfinity® VirtualUI™ for FireMonkey® Platform runtime: Runtime unit(s) included in the FireMonkey application

	Fire	lonkey [®]	
Win32 - Win64 platform	Mac OS platform	iOS platform	FMX
N	Č	105	

Thinfinity® VirtualUI[™] for FireMonkey® Platform runtime is a set of Delphi units that plugs into FireMonkey's framework to redirect Windows calls and drawing commands to the remote HTML5 canvas

FireMonkey Applications

Requirements:

Applications

- The application project must use the FireMonkey HD framework.
- Delphi XE3 or Delphi XE4

Thinfinity® VirtualUI™ for FireMonkey® Server

- Windows XP 32-bit / Windows XP 64-bit
- Windows Vista 32-bit / Windows Vista 64-bit
- Windows 7 32-bit / Windows 7 64-bit
- Windows Server 2008 32-bit / Windows Server 2008 64-bit

Web Client

• HTML5-compliant Web Browser

7

3 Getting Started

To get started, use this section to cover the fundamental aspects of Thinfinity® VirtualUI™ for FireMonkey®. You will learn how to create all the needed configurations in a simple step by step guide so that you can start enjoying the benefits of Thinfinity® VirtualUI™ for FireMonkey®:

- 1. Installing Thinfinity® VirtualUI™ for FireMonkey®
- 2. Compiling and testing your application
- 3. Registering the application in Thinfinity® VirtualUI™ for FireMonkey® Server
- 4. Accessing an application from the Web

Find a more exhaustive reference of the available options here:

Programming Reference Thinfinity® VirtualUI™ for FireMonkey® Server Manager Managing the SSL Certificate Appendix A - Dialogs Appendix B - Tailoring the interface Appendix C - JavaScript API 8

3.1 Installing Thinfinity[®] VirtualUI[™] for FireMonkey[®]

1. Download the installer from the Cybele Software site download page:

http://www.cybelesoft.com/downloads/

2. Execute the installer on the target machine.

InstallShield Wizard	
	Preparing to Install
0	Thinfinity® VirtualUI™ for FireMonkey® Setup is preparing the InstallShield Wizard, which will guide you through the program setup process. Please wait.
	Extracting: WebFMXSetup.msi
	Cancel

3. Select type of environment to install:

Thinfinity® VirtualUI™ for FireMonkey® Server

This environment is where FireMonkey apps will be run and remotely accessed. This is not needed for development purposes but it could be installed for testing the application.

The Thinfinity® VirtualUI[™] for FireMonkey® Server is an HTTP/WebSocket Server that maintains the communication between the web browser and the Thinfinity® VirtualUI[™] for FireMonkey® Runtime inside the FireMonkey application.

On this installation mode, the Thinfinity® VirtualUI[™] for FireMonkey® Server will be installed as a Windows Service.

Development Environment

This environment is meant to be installed on the developer machine. This mode installs the Thinfinity® VirtualUI[™] for FireMonkey® runtime units that you need to include in your FireMonkey application's project. It includes also a Thinfinity® VirtualUI[™] for FireMonkey® Server that will execute in a 'development mode', to quickly test your application from a Web Browser.

4. Press Next and wait for the installation process to finish. When it's done, press the 'Finish' button.

🛃 Thinfinity	/® VirtualUI™ for FireMonkey® - InstallShield Wizard 📃 🔲 🗾

3.2 Compiling and testing your application

In order to create a dual Windows/HTML5 FireMonkey application, you have to compile this application including the WebFMX.dcu unit. By default, the WebFMX.Platform.dcu unit will be accessible on the installation directory, under the folder below:

C:\Program Files\Thinfinity\VirtualUI for FireMonkey\dev\XE3\win32 C:\Program Files\Thinfinity\VirtualUI for FireMonkey\dev\XE3\win64 C:\Program Files\Thinfinity\VirtualUI for FireMonkey\dev\XE4\win32 C:\Program Files\Thinfinity\VirtualUI for FireMonkey\dev\XE4\win64

C:\Program Files\Thinfinity\VirtualUI for FireMonkey\dev\XE5\win32

C:\Program Files\Thinfinity\VirtualUI for FireMonkey\dev\XE5\win64

C:\Program Files\Thinfinity\VirtualUI for FireMonkey\dev\XE6\win32

C:\Program Files\Thinfinity\VirtualUI for FireMonkey\dev\XE6\win64

C:\Program Files\Thinfinity\VirtualUI for FireMonkey\dev\XE7\win32

- C:\Program Files\Thinfinity\VirtualUI for FireMonkey\dev\XE7\win64
- The source file will only be available when you install using the <u>Development</u> installation mode.
- If you install the <u>Development Environment</u> these paths will be automatically added to the Delphi XE3, XE4, XE5, XE6 and XE7 Library Paths (32 and 64 bit).

Follow the next steps to compile your application:

- 1. Open your Rad Studio or Delphi XE3, XE4, XE5, XE6, or XE7.
- 3. Open your application project.
- 4. Add the unit WebFMX.Platform to the Uses of your project source file.

program MyApp; uses FMX.Forms, WebFMX.Platform, MyApp.Main in MyApp.Main.pas' {Form1}; {\$R *.res} begin Application.Initialize; Application.CreateForm(TForm1, Form1); Application.Run; end.

5. Compile Your Program and Run it.

6. Observe on the Task Bar that the Thinfinity® VirtualUI[™] for FireMonkey® Development Server icon will appear.

7. Right-click on the icon, and after that click on the 'Open' menu.

A Web browser window will be opened with your application running inside.

If you don't want the debugging mode to start a new Thinfinity® VirtualUI™ for FireMonkey® Server or want to specify the port in which it will start, you can set change the <u>DevServer</u> property. You may also configure Thinfinity® VirtualUI™ for FireMonkey® not to open a new browser window while running your application.

12 Thinfinity® VirtualUI™ for FireMonkey®

3.2.1 Registering the application in Thinfinity® VirtualUI[™] for FireMonkey® Server

Each application that needs to be accessed through the Thinfinity® VirtualUI™ for FireMonkey® Server, has to be added as an application profile.

We consider you have already <u>Compiled and tested your application</u> with the Thinfinity® VirtualUI™ for FireMonkey® runtime units.

To create an application profile, follow these steps:

1. Open the Thinfinity® VirtualUI[™] for FireMonkey® Server Manager, available in the Start Menu.

- 2. Go to the 'Applications' tab.
- 3. Click on the 'Add' button.
- 4. Name the application and inform the application path and file name.
- 7. Press 'OK' and 'Apply' on the Server Manager screen.

Now the application is ready to be accessed from the web.

3.3 Accessing the app from the Web

Follow the next steps to access registered FireMonkey applications using a web browser:

- 1. Open your preferred web browser.
- 2. Type in the <u>Thinfinity® VirtualUI™ for FireMonkey® Server Address</u>.
- 3. Inform your username and password, if required.

4. If you have created only one profile application, Thinfinity® VirtualUI[™] for FireMonkey® Server will connect you to the application.

5. If you have created more than one profile application, the Start Page will be presented, so that you can pick one.

Open in a new browser window

a. Check the option 'Open in a new browser window' if you want the application to be opened in another tab.

b. Click on the application's icon you want to access.

Now you will be able to see and interact with your application from the browser window:

3.4 Application Execution behavior

After you compile your application with the WebFMX.Platform runtime unit, it can be run in two platforms: Windows and web (HTML5).

This topic is intended to let you know how your application will behave in each occasions:

Windows Shell:

When the application is started from the windows shell, it will behave as a regular Windows application.

Delphi:

When the application is run under Delphi, a development server instance will be started and the web platform will be started on a new browser window.

Thinfinity® VirtualUI[™] for FireMonkey® Service:

If the application is accessed through the Thinfinity® VirtualUI[™] for FireMonkey® Web Server, it will also work through the web platform (HTML5).

If you want to disable the HTML5 platform you can set the PlatformHTML5 Enabled property to false. That way the application will stop responding web requests.

This can be useful during an integration period, in case you want to release the application before you have finished the Thinfinity® VirtualUI™ for FireMonkey® integration, or if you want to debug your application using the Windows platform.

4 **Programming Reference**

Thinfinity® VirtualUI[™] for FireMonkey® provides programming resources in the WebFMX.Platform unit that will allow you to:

1. Retrieve information regarding the client browser and other end user environment variables such as the application's resolution, authentication information, IP and browser information.

- 2. Manipulate the application's resolution.
- 3. Manipulate the fonts and WebFonts mapping.
- 4. Download files.
- 5. Disable WebFMX.Platform and have only the Windows platform activated.
- 6. Enable/Disable the Development Server while debugging the application.

Getting Started

1. Add WebFMX.Platform into the uses list of the unit you are working with.

2. Access the global variable PlatformHTML5 and its properties, methods and events in order to access these programming resources.

See also

Throughout the next topics, find a detailed description of all public Thinfinity® VirtualUI^M for FireMonkey® classes, including the main <u>TPlatformHTML5</u>.

4.1 **TPlatformHTML5**

This class provides you access to all public methods, properties and events for interacting with some of the Thinfinity® VirtualUI^m for FireMonkey® settings and behaviors.

Properties

RemoteInfo DevServer Enabled FontMode

Methods

AddDefaultWebFonts ClearWebFonts DownloadFile ResizeRemote RegisterWebFont

Events

OnAppTerminate OnBrowserResize OnSupportsWebFonts

Remarks

The PlatformHTML5 global variable holds a TPlatformHTML5 class object that is automatically instantiated every time your application is executed.

See also

Find more information regarding the RemoteInfo and DevServer properties in the <u>TRemoteInfo</u> and <u>TDevServer</u> topics.

4.1.1 **Properties**

4.1.1.1 Remotelnfo

The RemoteInfo object allows you to retrieve information regarding the end-user environment as well as to manipulate some of its settings.

Delphi Syntax

var RemoteInfo : <u>TRemoteInfo</u>;

RemoteInfo := Object.RemoteInfo;

Remarks

Every time you run your application, the PlatformHTML5 object's RemoteInfo property will be loaded with the user environment settings and all these values will be kept updated by Thinfinity® VirtualUI™ for FireMonkey® Server.

See also

Read the <u>DevServer topic</u> for settings regarding the Development Server.

4.1.1.2 DevServer

The DevServer object allow you to configure the Development Server behavior. The Development Server is the server which is started while you debug your application with Thinfinity® VirtualUI[™] for FireMonkey® Runtime Units.

Delphi Syntax

var DevServer : <u>TDevServer</u>;

DevServer := Object.DevServer;

Remarks

Every time you run your application, the PlatformHTML5 object's DevServer property will be loaded with the Server default values.

See also

You may also find useful the <u>Application Execution behavior</u> topic.

4.1.1.3 Enabled

Enables/disables the Thinfinity® VirtualUI^m for FireMonkey® Platform. By default this property is set to true, if you set it to false, the application will not be accessed from the web.

Delphi Syntax

Object.Enable [:= Boolean];

Remarks

When enabled, the applications uses Thinfinity $\ensuremath{\mathbb{R}}$ VirtualUI^ $\ensuremath{\mathbb{M}}$ for FireMonkey $\ensuremath{\mathbb{R}}$ platform when:

a) The application is run under Delphi

b) The application is accessed through the Thinfinity® VirtualUI™ for FireMonkey® Web Server.

When the application is started from the Windows shell, it will behave as a regular Windows application.

See also

See also The Application Execution behavior topic.

4.1.1.4 FontMode

There are some Windows fonts that are not supported or don't exist in Web format. Through the FontMode property you may configure how Thinfinity® VirtualUI[™] for FireMonkey® should solve these fonts issues:

Delphi Syntax

```
Object.FontMode [: = <u>TFontMode</u>];
```

See also

Read also the <u>TFontMode</u> topic in order to understand how each mode will work.

4.1.2 Methods

4.1.2.1 AddDefaultWebFonts

This method adds default font mappings for non-supported WebFonts that are known by Thinfinity® VirtualUI™ for FireMonkey® Server.

Delphi Syntax

Remarks

So far, the known non supported fonts configured by default on Thinfinity® VirtualUI[™] for FireMonkey® Server along with its mappings are:

Segoe UI	Open+Sans: 400italic, 700italic, 400, 700
Segoe UI Light	Open+Sans: 300italic, 300

See also

Read also the <u>TFontMode</u> topic, the <u>OnSupportsWebFont</u> event topic and the <u>ClearWebFonts</u> and <u>RegisterWebFont</u> method topics.

4.1.2.2 ClearWebFonts

This method clears all default and registered WebFont mappings.

Delphi Syntax

Object.ClearWebFonts;

Remarks

Once you call this method to clear all the default and registered WebFont mappings, you should either set the <u>TFontMode</u> to fmBitmap or fmAuto or also Register new WebFont mappings through the <u>RegisterWebFont</u> method.

See also

You may find useful the <u>TFontMode</u> and <u>FontMode</u> topics, the <u>OnSupportsWebFont</u> event topic and the <u>AddDefaultWebFonts</u> and <u>RegisterWebFont</u> method topics.

4.1.2.3 DownloadFile

This method downloads a given file to the remote machine.

Delphi Syntax

Object.DownloadFile (FileName: String);

Arguments

be downloaded.		FileName	The complete path of the file to be downloaded.	String
----------------	--	----------	---	--------

Remarks

The File Upload will work automatically, without having to call any method.

See also

Read also about the <u>ResizeRemote</u> method.

4.1.2.4 ResizeRemote

This method resizes the remote application to a given width and height value.

Delphi Syntax

Object.ResizeRemote (width, height: Integer);

Arguments

width	The resized width value for the application in pixels.	Integer
height	The resized height value for the application in pixels.	Integer

See also

Read about the <u>OnBrowserResize</u> event and the <u>RemoteInfo</u> property.

4.1.2.5 RegisterWebFont

This method registers a new WebFont mapping.

Delphi Syntax

Object.RegisterWebFont (FontName, FontEquiv, FontGoogle: String));

Arguments

FontName	This is the Windows font name that will be mapped to a WebFont.	String
FontEquiv	This is the name that will be used to register the new font.	String
FontGoogle	This is the Google WebFont URL queryString. For more information regarding it, read this google reference.	String

See also

You may also find the <u>TFontMode</u> and <u>FontMode</u>, the <u>OnSupportsWebFont</u> event and the <u>AddDefaultWebFonts</u> and <u>ClearWebFonts</u> method topics useful.

4.1.3 Events

4.1.3.1 OnAppTerminate

This event is fired whenever the application is going to be terminated.

Delphi Syntax

Object.OnAppTerminate := MyOnAppTerminate; procedure MyOnAppTerminate(Sender: TObject); begin // Your code here end;

Arguments

|--|

Remarks

When this event is fired the application termination can't be undone anymore.

4.1.3.2 OnBrowserResize

This event is fired whenever the end-user resizes the browser window.

Delphi Syntax

Object.OnBrowserResize := MyBrowserResizeEvent;

procedure MyBrowserResizeEvent(Sender: TObject; var AHandled: Boolean);
begin
 AHandled := True;
 // Your code here
end:

Arguments

Sender	The Sender object.	TObject
AHandled	Prevents Thinfinity® VirtualUI [™] for FireMonkey® from resizing automatically the application, when the <u>ScreenResolution</u> property is set to 'srFitToBrowser' or 'srFitToScreen'.	Boolean

See also

Read the <u>ResizeRemote</u> and the <u>RemoteInfo</u> topics.

4.1.3.3 OnSupportsWebFont

The OnSupportsWebfont event is fired when a browser connects to the application. Inside this event you can describe how Thinfinity® VirtualUI[™] for FireMonkey® should handle the fonts mapping.

Delphi Syntax

```
Object.OnSupportsWebfont := MySupportsWebFont;
procedure MySupportsWebFont(Sender: TObject; var ASupports: Boolean);
begin
    ASupports := True;
    // Your code here
end;
```

Arguments

Sender	The Sender object.	TObject
ASupports	Indicates whether the browser should support WebFonts or not. If set to false, the <u>FontMode</u> will be set to <u>fmBitmap</u> .	Boolean

Remarks

In order to find out the kind of browser that is connecting to the application, you should read the <u>RemoteInfo.UserAgent</u> property.

The code below is used as a default behavior that allows Thinfinity® VirtualUI™ for FireMonkey® to disable WebFonts for versions under 6 of iPad, iPod and iPhone.

```
iOS := (Pos('iPad',RemoteInfo.UserAgent)>0) or (Pos('iPod',RemoteInfo.UserAgent)>0) or
(Pos('iPhone',RemoteInfo.UserAgent)>0);
if iOS then
begin
  MajorVersion := StrToInt(Copy(RemoteInfo.UserAgent,Pos('Version/',RemoteInfo.
  UserAgent)+8,1));
  FSupportsWebFont := (MajorVersion>=6);
end;
```

See also

Read the <u>TFontMode</u>, <u>FontMode</u>, <u>AddDefaultWebFonts</u> <u>ClearWebFonts</u> and <u>RegisterWebFont</u> topics.

4.2 TRemoteInfo

The TRemoteInfo class holds the properties related to the end-user remote environment information.

Properties

Width Height BrowserWidth BrowserHeight ScreenWidth ScreenHeight Username UniqueBrowserId PeerIP UserAgent ScreenResolution

Remarks

Whenever you run your application, a TRemoteInfo object is instantiated automatically and set as a property of the <u>PlatformHTML5</u> object.

See also

Read about the TPlatformHTML5 <u>DevServer</u> property.

4.2.1 Properties

4.2.1.1 Width

Current width of the application.

Delphi Syntax

var width : Integer; width := Object.Width;

Remarks

The width is a read-only property. In order to modify the application width, you should use the <u>ResizeRemote</u> method.

See also

You may also read the topics <u>Height</u>, <u>BrowserWidth</u>, <u>BrowserHeight</u>, <u>ScreenWidth</u>, <u>ScreenWidth</u>, <u>ScreenResolution</u>.

4.2.1.2 Height

Current height of the application.

Delphi Syntax

var height : Integer; height := *Object*.Height;

Remarks

The height is a read-only property. In order to modify the application height, you should use the <u>ResizeRemote</u> method.

See also

You may also read the topics <u>Width</u>, <u>BrowserWidth</u>, <u>BrowserHeight</u>, <u>ScreenWidth</u>, <u>ScreenHeight</u> and <u>ScreenResolution</u>.

4.2.1.3 BrowserWidth

Current width of the end-user browser window.

Delphi Syntax

var browserWidth : Integer; browserWidth := Object.BrowserWidth;

Remarks

The browserWidth is a read-only property. In order to modify the application width, you should use the <u>ResizeRemote</u> method.

See also

You may also read the topics <u>Width</u>, <u>Height</u>, <u>BrowserHeight</u>, <u>ScreenWidth</u>, <u>ScreenHeight</u> and <u>ScreenResolution</u>.

4.2.1.4 BrowserHeight

Current height of the end-user browser window.

Delphi Syntax

var browserHeight : Integer; browserHeight := Object.BrowserHeight;

Remarks

The browserHeight is a read-only property. In order to modify the application height , you should use the <u>ResizeRemote</u> method.

See also

You may also read the topics <u>Width</u>, <u>Height</u>, <u>BrowserWidth</u>, <u>ScreenWidth</u>, <u>ScreenWidth</u>, <u>ScreenResolution</u>.

4.2.1.5 ScreenWidth

Width of the end-user screen.

Delphi Syntax

var screenWidth : Integer; screenWidth := Object.ScreenWidth;

Remarks

The screenWidth is a read-only property. In order to modify the application width, you should use the <u>ResizeRemote</u> method.

See also

You may also read the topics <u>Width</u>, <u>Height</u>, <u>BrowserWidth</u>, <u>BrowserHeight</u>, <u>ScreenHeight</u> and <u>ScreenResolution</u>.

4.2.1.6 ScreenHeight

Height of the end-user screen.

Delphi Syntax

var screenHeight : Integer; screenHeight := *Object*.ScreenHeight;

Remarks

The screenHeight is a read-only property. In order to modify the application height, you should use the <u>ResizeRemote</u> method.

See also

You may also read the topics <u>Width</u>, <u>Height</u>, <u>BrowserWidth</u>, <u>BrowserHeight</u>, <u>ScreenWidth</u> and <u>ScreenResolution</u>.

4.2.1.7 Username

WebFMX authenticated username.

Delphi Syntax

var userName : String; userName := Object.UserName;

Remarks

The UserName is a read-only property.

See also

Read the <u>Permissions</u> topic to learn how to give permission to access your application to users.

4.2.1.8 UniqueBrowserld

UniqueBrowserID identifies an instance of a Web Browser. Each time an end-user opens the application from a different browser window, this ID will have a different value.

Delphi Syntax

var browserID : String; browserID := *Object*.UniqueBrowserID;

Remarks

The UniqueBrowserID is a read-only property.

See also

Read the <u>UserAgent property</u> topic to learn how to retrieve more information about

the end-user web browser.

4.2.1.9 PeerIP

P address of the end-user.

Delphi Syntax

var peerIP : String;
peerIP := Object.PeerIP;

Remarks

The PeerIP is a read-only property.

See also

Besides the end-user IP, you may have more information regarding the end-user browser through the <u>UserAgent</u> property.

4.2.1.10 UserAgent

User-Agent of the browser that has been used to open the Thinfinity® VirtualUI™ for FireMonkey® application.

Delphi Syntax

```
var userAgent : String;
userAgent := Object.UserAgent;
```

Remarks

The UserAgent is a read-only property.

See also

Read the UniqueBrowserID property topic to learn how to retrieve more information

regarding the web browser.

4.2.1.11 ScreenResolution

This property holds the Resolution configured on the <u>application profile</u>.

Delphi Syntax

var resolution : String; resolution := Object.ScreenResolution;

Remarks

Thinfinity® VirtualUI[™] for FireMonkey® allows you to configure different resolutions for the Web interface, as explained in the <u>application profile settings</u>. The <u>possible resolutions</u> include 'Fit to browser window' and 'Fit to screen'. These two options will adjust the application resolution according to the browser and screen size, respectively. The other resolution options are fixed values for the width and height of the application surroundings, such as '640X480' and '800X600'. When you select one of these fixed resolution values for your application, Thinfinity® VirtualUI[™] for FireMonkey® will not resize automatically the application when an end-user resizes its browser window.

In order to modify the application resolution, you should use the <u>ResizeRemote</u> method.

Thinfinity® VirtualUI[™] for FireMonkey® also provides the <u>OnBrowserResize</u> event that will be fired whenever the end-user resizes their browser window. Through this event, you will be able to customize the application resizing behavior. You may use the environment variables provided on the <u>RemoteInfo</u> object, such as BrowserWidth, BrowserHeight, ScreenWidth and ScreenHeight in order to find out the user environment dimensions.

See Also

You may also read the <u>Width</u>, <u>Height</u>, <u>BrowserWidth</u>, <u>BrowserHeight</u>, <u>ScreenWidth</u> and <u>ScreenHeight</u> topics.

4.3 **TDevServer**

The TDevServer class holds the properties that allow you to modify some of the Development Server settings.

Properties

Enabled Port StartBrowser

Remarks

Whenever you run your application, a TDevServer object is instantiated automatically as a property of the <u>PlatformHTML5</u> object. Read the <u>DevServer</u> property topic for more information.

See also

Read about the TPlatformHTML5 <u>RemoteInfo</u> property.
4.3.1 Properties

4.3.1.1 Enabled

Allows you to disable the development server that runs whenever you compile an application with the WebFMX.Platform runtime unit.

Delphi Syntax

Object.Enabled [: = Boolean];

Remarks

Enabled is a read/write property.

See also

If you were looking to disable the whole PlatformHTML5, read this topic: Enabled.

4.3.1.2 Port

Allows you to change the port on which the Development Web Server will answer.

Delphi Syntax

Object.Port [:= Integer];

Remarks

The Port is a read/write property.

See also

Read the Enabled and StartBrowser topics.

4.3.1.3 StartBrowser

Configures whether the server will open a new browser window when running the application from the development environment.

Delphi Syntax

Object.StartBrowser [:= Boolean];

Remarks

The StartBrowser is a read/write property.

See also

Read the <u>Enabled</u> and <u>Port</u> topics.

4.4 **TFontMode**

The TFontMode enumerates the possible <u>Font Modes</u> that Thinfinity® VirtualUI^m for FireMonkey® works with.

Values

fmWebFont	This mode sets the application to use Web Fonts. Thinfinity® VirtualUI [™] for FireMonkey® automatically maps some not supported fonts and you are able to map others by calling the method <u>RegisterWebFont</u> for each one of them.
fmBitmap	This mode will send each letter as a small png image and will store them into the web browser cache. This will ensure maximum fidelity, but it can sometimes be a little slower than the WebFonts mode.
fmAuto	Under this mode, Thinfinity® VirtualUI [™] for FireMonkey® will use WebFont or Bitmap based on the result of the <u>OnSupportsWebFont</u> event. Inside the event you should indicate the environments where the WebFonts should be enabled and the other ones where Thinfinity® VirtualUI [™] for FireMonkey® should work with the Bitmaps mode.

See also

Read about the <u>FontMode</u> property, the <u>OnSupportsWebFont</u> event and the methods <u>AddDefaultWebFonts</u>, <u>ClearWebFonts</u> and <u>RegisterWebFont</u>.

4.5 **TScreenResolution**

The TScreenResolution data type enumerates all the possible application resolution modes:

Values

40

srCustom	The width and height of the application will be custom values that will be indicated separately.
srFitToBrowser	The width and height of the application will be the same as the end-user browser window. Whenever the end-user resizes the remote browser window Thinfinity® VirtualUI™ for FireMonkey® will resize the application width automatically.
srFitToScreen	The width and height of the application will correspond to the end-user screen width and height. Whenever the end-user resizes the remote browser window Thinfinity® VirtualUI™ for FireMonkey® will resize the application height automatically.
sr640x480	The width of the application will be set to 640 and the height to 480 pixels.
sr800x600	The width of the application will be set to 800 and the height to 600 pixels.
sr1024x768	The width of the application will be set to 1024 and the height to 480 pixels.
sr1280x720	The width of the application will be set to 1280 and the height to 720 pixels.
sr1280x768	The width of the application will be set to 1280 and the height to 768 pixels.
sr1280x1024	The width of the application will be set to 1280 and the height to 1024 pixels.
sr1440x900	The width of the application will be set to 1440 and the height to 900 pixels.
sr1440x1050	The width of the application will be set to 1440 and the height to 1050 pixels.

© 2014, Cybele Software Inc.

sr1600x1200	The width of the application will be set to 1600 and the height to 1200 pixels.
sr1680x1050	The width of the application will be set to 1680 and the height to 1050 pixels.
sr1920x1080	The width of the application will be set to 1920 and the height to 1080 pixels.
sr1920x1200	The width of the application will be set to 1920 and the height to 1200 pixels.

5 Thinfinity[®] VirtualUI[™] for FireMonkey[®] Server Manager

тм

The Thinfinity® VirtualUI[™] for FireMonkey® Server Manager is the tool to manage the Thinfinity® VirtualUI[™] for FireMonkey® Server, from where you can manage FireMonkey's applications profiles, permissions and settings related to the Thinfinity® VirtualUI[™] for FireMonkey® service.

To access The Thinfinity® VirtualUI™ for FireMonkey® Server Manager go over the Start Menu options and look for the 'Thinfinity® VirtualUI for FireMonkey® Server Manager' item.

The Thinfinity® VirtualUI[™] for FireMonkey® Server Manager is has the following tabs:

General Applications Licences

Its main menu has two sub-menus:

File Menu:

Language	×	✓	English	
Save		Г		
Exit				

The File Menu is composed by the following options:

Language	Allows you to choose different languages for the application. Click on the Language that you want the application to work with. English is the default language.	
Save	Click to save any change done on the system Settings.	
Exit	Click on this option to exit the Thinfinity® VirtualUI™ for FireMonkey® Server Manager.	

Help Menu:

Help
Buy
About Thinfinity VirtualUI for FireMoney

The Help Menu is composed by the following options:

Help	Takes you to the online application guide.
Buy	Takes you to the Cybele Software's 'Buy' page.
About Thinfinity® VirtualUI™ for FireMonkey®	Click on the 'About' to see the application version and build number.

5.1 General

Thinfinity VirtualUI for FireMonkey - Server Manager	x
Eile Help General Applications Licenses	
Thinfinity® VirtualUI for FireMonkey®	
Communication Settings	n
Bind to IP: (All unassigned)	
Protocol: HTTPS	
Port: 6880	
Server started. Listening https on port 6880	

In the Thinfinity® VirtualUI™ for FireMonkey® manager 'General' tab you will find the following options:

Bind to IP	Use this option to restrict access to the service to one specific IP address. The 'All unassigned' option allows access through all the available IP addresses.	
Protocol	Choose between the http and https protocol.	
Manage Certificate	Allows you to specify the SSL certificate. Thinfinity® VirtualUI™ for FireMonkey® Server already comes with a self-signed certificated that is good enough for testing purposes.	
Port	Choose which port will Thinfinity® VirtualUI™ for FireMonkey® Server be listening on. If the port is not available, you will see an error message on the status bar.	

Always remember to press 'Apply' in order to save the changes.

5.2 Applications

The 'Applications' tab will allow you to configure the FireMonkey applications locations and settings as well as the user permissions to access them.

Thinfinity VirtualUI for FireMonkey - Server Manager				
<u>File H</u> elp General Applications Lice	inses			
Application list:				
Name	Target			
	Add Edit Remove			
Allowed users and group	s for selected application:			
📝 Anonymous access				
Database path: C:\Pr	ogramData\Cybele Software\WebFMX\DB\			
L	Apply Close			

In the Thinfinity® VirtualUI^M for FireMonkey® Server Manager 'Applications' tab you will find the following options:

	This list shows the available applications. You can enable or disable them by checking the box to the left of the name.		
Application List	Name	Name of the application.	
	Target	The application path and the web address in case of the Web Link profiles.	
Add	Press this button to add a new application.		
Edit	Select an application and press this button to edit it.		
Remove	Select an application and press this button to remove it.		

Allowed users and groups for selected profile	See here the allowed users or group(s) of users for the selected application. If you want to change the permissions, edit the application.
Database path	When the application is set to work with Load Balancing, you can set a common database path to all Thinfinity® VirtualUI™ for FireMonkey® Brokers by informing it on this field.

Always remember to press 'Apply' in order to save the changes.

5.2.1 Application profile

When you edit or add an application profile you will be presented with this screen below. The radio button 'Application' must be checked.

🎝 Thinfinity VirtualU	I for FireMonkey Application Profiles Editor	- • •
Name:	ControlsDemo	
Virtual Path:	ControlsDemo Page:	
Anna Kau		
Access key:	IMIxqWfTBpaTxCbIw87u4iIzubbd0nzJh6WdbwFU1mgspYaj	
Icon:	Application Web Link	New Key
	Default application	
General Credentials	Permissions	
Program pa c:\Source\7	th and file name: ThinfinityRDW\ControlsDemo.exe	Open
Arguments:		
Start in the	following folder:	
c:\Source\7	ThinfinityRDW	
Resolution: Idle Timeou	Fit to browser window	
	Ok	Cancel

These are the profile properties you can edit:

Name	Use this field to change the application name.	
Virtual Path	The Virtual Path will create a unique URL address for this connection. The complete path will consist of: http(s)://ThinfinityVirtualUIforFiremonkeyDomain: port/VirtualPath/. The users can then create a web shortcut to this connection in particular and bypass the Thinfinity® VirtualUI™ for FireMonkey® web interface.	
Page	Write a page name to be shown in the url instead of the default (index.html)	
Access Key	This Access Key identify the application within Thinfinity® VirtualUI™ for FireMonkey® Server. It is used when you want to debug your application, for example.	

New Key	This button will change the Access Key and disable access through the current key. A new access key will be provided.
lcon	Click on the Icon gray box to load an image to be associated with the profile. The image will be presented along with the profile name on the web interface profiles selection.
Application /Web link	Select the Application option to have a regular profile that gives access to a FireMonkey application. If you select the Web link radio button, this profile will behaves like a Web Hyperlink.
Default Application	Make this the default application. Users will connect to the default appliccation when accessing with / instead of index.html

The properties located inside the tabs will be described throughout the next subtopics.

5.2.1.1 General

In the application profile editor's 'General' tab you will find the following options:

🎝 Thinfinity VirtualU	I for FireMonkey Application Profiles Editor	
Name:	ControlsDemo	
Virtual Path:	ControlsDemo F	'age:
Access Key:	iMIxqWfTBpaTxCbIw87u4iIzubbd0nzJh6WdbwFU1mgspYaj	
Icon:	Application Web Link	New Key
	Default application	
General Credentials	Permissions	
Program pa c:\Source\T Arguments:	th and file name: ThinfinityRDW\ControlsDemo.exe	Open
Start in the	following folder:	
c:\Source\7	ThinfinityRDW	
Resolution: Idle Timeou	Fit to browser window • • • • • • • •	
		Ok <u>C</u> ancel

Program path and file name	Specify the complete path that gives access to the application executable file.
Arguments	Applications arguments
Start in the following folder	Inform a context directory for the application set on the field 'Program path and file name'
Resolution	Choose from the available list of resolutions including 'Fit to browser window' and 'Fit to screen', ideal for hiding the browser and working on a full screen mode.

Idle Timeout	 Set a timeout in minutes if you want Thinfinity® VirtualUI™ for FireMonkey® Server to wait this period before killing the application once the browser has been closed. Timeout 0 will kill the application immediately after the browser has been closed.
--------------	--

5.2.1.2 Credentials

In the application profile editor's 'Credentials' tab you will find the following options:

General Credentials Permissions

-			
Ose the au	thenticated credential	S	
O Use these	credentials:		
User name:			

Use the authenticated credentials	Use the same credentials entered in the browser for Thinfinity® VirtualUI [™] for FireMonkey® (specified in the 'Permissions' tab). Note: If the credentials are correct, this option will connect the user automatically when selecting the application, or after authenticating for Thinfinity® VirtualUI [™] for FireMonkey® if this is the only profile for their credentials.
Ask for new credentials	Prompt the user for new credentials to access the computer.
Use these credentials	Complete the credentials used to access the computer. Note: If the credentials are correct, this option will connect the user automatically when selecting the application, or after authenticating for Thinfinity® VirtualUI™ for FireMonkey® if this is the only profile for their credentials.

5.2.1.3 Permissions

In the application profile editor's 'Advanced' tab you will find the following options: Select the users that will access this application. If you don't select any user, this application will not be accessed.

General Credentials Permissions	
Allow anonymous access	
Group or user names:	
	Add Remove

Allow anonymous access	Check this option to make this application available without any authentication. This means that everybody accessing Thinfinity® VirtualUI™ for FireMonkey® will have access to this application. Checking this option will disable the Add and Remove buttons.
Add	Press 'Add' to access the windows dialog for selecting Active Directory users.
Remove	Press 'Remove' to remove a user for this profile.

If you want a user or a user group to access more than one application, you need to create more application profiles and then add this user to each profile.

The authenticated user will be able to choose from the available application profiles on the Web interface.

5.2.2 Weblink profile

 $When \ \text{you} \ \text{edit} \ \text{or} \ \text{add} \ \text{a} \ \text{Web} \ \text{Link} \ \text{profile} \ \text{you} \ \text{will} \ \text{be} \ \text{presented} \ \text{with} \ \text{this screen below}.$ The radio button 'Web Link' must be checked.

Icon:	Application Web Link	New Key
	Default application	
Web Link Permission	s	
Group or user na	nous access	
		Add Remove
		O <u>k</u> <u>C</u> ancel

Allow anonymous access	Check this option to make this application available without any authentication. This means that everybody accessing Thinfinity® VirtualUI™ for FireMonkey® will have access to this application. Checking this option will disable the Add and Remove buttons.
Add	Press 'Add' to access the windows dialog for selecting Active Directory users.
Remove	Press 'Remove' to remove a user for this profile.

If you want a user or a user group to access more than one application, you need to create more profiles and then add this user to each profile.

The authenticated user will be able to choose from the Web interface which application s/he will connect to.

5.3 Licenses

On the Thinfinity® VirtualUI™ for FireMonkey® Manager 'Licenses' tab you will find the following options:

Thinfinity VirtualUI fo	or FireMonkey - Server Manager	×
<u>File H</u> elp		
General Applications	; Licenses	
Status:	Trial Expired	
Days left:	-1	
License Type	2 Full trial license	

This tab always shows the currently installed licenses. If you don't have a license yet, you will see a message letting you know how many evaluation days you have left until the trial finishes.

<u>Contact us</u> regarding pricing and/or licensing questions.

6 Managing the SSL Certificate

An SSL certificate is an effective way to secure a website against unauthorized interception of data. At its simplest, an SSL Certificate is used to identify the website and encrypt all data flowing to and from the Certificate holder's Web site. This makes all exchanges between the site and its visitors 100% private. A valid SSL certificate is included with the Thinfinity® VirtualUI[™] for FireMonkey® Server installation and all communications are already encrypted with the product's default certificate. You may want to create your own certificate to identify your company better.

Managing the SSL Certificate

- 1. There are two ways of creating your own SSL certificate:
 - a. Create <u>A self-signed certificate</u>
 - b. Use <u>A CA Certificate</u>

2. Once you already have your certificate files, go to Thinfinity $\ensuremath{\mathbb{R}}$ VirtualUI^ for FireMonkey $\ensuremath{\mathbb{R}}$ Server Settings 'General tab'.

- 3. Click on the 'Manage Certificate' option.
- 4. On this screen you should inform the location of the certificate files, as follows:

Certificate File Inform the path to the certificate file.

CA File

If the certificate is issued by a unknown CA, you should fill in the pathname to the CA certificate.

Private Key You should inform the pathname to the certificate private key file.

Pass Phrase

Inform the password, if there is any, used when the private key was generated.

Note: The path names can be absolute (C:\MyCertPath\UserThisCert.pem) or relative to the path where Thinfinity® VirtualUI[™] for FireMonkey® Server is installed (\cert\UserThisCert.perm).

© 2014, Cybele Software Inc.

6.1 The Default Embedded Certificate

A certificate called 'self-signed.pem' is included with the Thinfinity® VirtualUI[™] for FireMonkey® Server installation. You will find it inside the \cert directory, located inside the Thinfinity® VirtualUI[™] for FireMonkey® Server application path.

If you want to use this default certificate you should have the files set as the image below:

Manage SSL Certificat	e	×
		_
Certificate File:	cert\self-signed.pem	
CA File:	cert\self-signed.pem	
Private Key:	cert\self-signed.pem	
PassPhrase:		
	Create a self-signed certficate	
	Create a certficate request	
	Ok Cancel	

You'll find these settings inside the Thinfinity® VirtualUI[™] for FireMonkey® Server Manager 'General' tab, by clicking on the 'Manage certificate' button.

Because this certificate is not issued by a known Certificate Authority (CA), the web browsers will warn you they can not verify its authority.

6.2 A Self-signed Certificate

This option is used to create your own self-sign certificate.

- 1. Go to the Thinfinity® VirtualUI[™] for FireMonkey® Server Settings 'Security' tab.
- 2. Press the 'Manage certificate' button.
- 3. Press the 'Create a self-signed certificate' button.
- 4. Fill in the form below with your organization data:

Create self-signed certificate and private key
Certificate Properties
Country Code:
State:
Locality:
Organization:
Organizational Unit:
Common Name:
E-Mail address:
Bits: >= 512
Certificate and private key are written to the same file. Private key will not be password protected.
Create Close

5. The 'Common Name' field should be filled with the server+domain that will be used to access the Thinfinity® VirtualUI™ for FireMonkey® Server (*ThinfinityVirtualUIforFireMonkey.mycompany.com*).

- 6. Press 'Create'.
- 7. Select the location where you want the certificate to be stored.
- 8. The application will start using this self-signed certificate just created by you.

Because this certificate is not issued by a known Certificate Authority (CA), the web browsers will warn you they can not verify its authority.

6.3 A CA Certificate

In order to use this option you will have to get a certificate from a known Certificate Authority (CA). Some CA examples are GoDaddy, VeriSign, Thawte, GeoTrust and Network Solutions.

The CA will ask you for a 'certificate request'. Create one following the next steps:

- 1. Go to the Thinfinity® VirtualUI™ for FireMonkey® Server Settings 'Security tab'.
- 2. Press the 'Manage certificate' button.
- 3. Click on the 'Create a certificate request' button.
- 4. Fill in the form below with your organization data:

Create certificate reques	t and private key	—
Certificate Properties		
Country Code:		
State:		
Locality:		
Organization:		
Organizational Unit:		
Common Name:		
E-Mail address:		
Bits:	>= 512	
Request and p Private key w	private key are written to ill not be password protec	different files. :ted.
	Create Close	

5. The 'Common Name' field should be filled with the server+domain that will be used to access the Thinfinity® VirtualUI™ for FireMonkey® server (*ThinfinityVirtualUIforFireMonkey.mycompany.com*)

6. Press 'Create' and the application will generate two files.

7. The first window will ask you a location to keep the private key file: 'Where do you want the private key file to be stored'.

- a. Inform a name for your private key.
- b. Select a place to keep it safe.
- c. Press the 'Save' button.

8. The second window will ask you a location to keep the request file: 'Where do you want the request file to be stored.'.

- a. Inform a name for the request file.
- b. Select a directory where you can find the file later on to send to the CA.
- c. Press the 'Save' button.
- 9. The first file is the certificate private key. It should always be kept safe with you.
- 10. Send only the request file to the CA.

After the CA validation process, place the certificate they sent to you on Thinfinity® VirtualUI[™] for FireMonkey® Server cert directory and inform the path to the files on Thinfinity® VirtualUI[™] for FireMonkey® Server Manager, <u>Manage Certificate</u> option (Certificate file, CA file and Private Key).

7 Appendix A - Dialogs

In Thinfinity® VirtualUI^m for FireMonkey®, window frames have a 'web-native' interface. The same happens with standard dialog boxes, that are translated to HTML dialogs.

Find on the next topics how each one of these dialogs will be shown on the Windows and HTML5 platforms:

Message Dialogs

MessageDlg InputBox Formatted Message

Printing Dialogs

Page Setup Print

File Dialogs

<u>Open File</u> <u>Save As</u>

7.1 Message Dialogs

The Message Dialogs implemented in Thinfinity® VirtualUI™ for FireMonkey® are:

MessageDlg InputBox Formatted Message

7.1.1 Message Dlg

Usage Example

MessageDlg ('Would you like to continue?', mtConfirmation, [mbYes, mbNo], 0);

This is how the dialog is shown on each platform:

Windows Platform

Confirm		3
?	Would you like to continue?	
	Yes <u>N</u> o	

HTML5 Platform

Confirmation	
?	Would you like to continue?
	Yes No

Find on the table below how the Windows MessageDlg Symbols will be presented on the $\ensuremath{\mathsf{HTML5}}$ Platform:

DialogType	Windows Platform	HTML5 Platform
mtWarning	<u> </u>	(!)
mtError	\bigotimes	\bigotimes
mtInformation	i	í
mtConfirmation	2	?

7.1.2 Input Box

Usage Example

```
value := InputBox( 'Input Test' , 'Please type a name' , " );
```

This is how the dialog is shown on each platform:

Windows Platform

Input Test	×
Please type a name	
	OK Cancel

HTML5 Platform

Input Test	x
Please type a name	
	OK Cancel

7.1.3 Formatted Message

66

Usage Example

```
ShowMessageFmt( '%d/%d = %1.2f', [2, 5, 2/5] );
```

This is how the dialog is shown on each platform:

Windows Platform

HTML5 Platform

7.2 Printing Dialogs

The Printing Dialogs implemented in Thinfinity® VirtualUI[™] for FireMonkey® are:

<u>PageSetup</u> <u>Print</u>

7.2.1 Page Setup

Usage Example

type PageSetupDialog1: TPageSetupDial 	og;
PageSetupDialog1.Execute;	

This is how the dialog is shown on each platform:

Print all	Selection
Pages	
Number of copies: 1	
	OK Cancel

7.3 File Dialogs

The File Dialogs implemented in Thinfinity $\ensuremath{\mathbb{R}}$ VirtualUI^{\mbox{\scriptsize M}} for FireMonkey $\ensuremath{\mathbb{R}}$ are:

<u>Open File</u> <u>Save As</u>

7.3.1 Open File

Usage Example

```
type
OpenDialog1: TOpenDialog;
...
OpenDialog1.Title := 'Open file';
OpenDialog1.Execute;
```

This is how the dialog is shown on each platform:

Windows Platform

HTML5 Platform

Upload File	×
Please, select or drop a file:	
	Browse
	Upload
	Cancel

In order to open a File from the remote machine the user will be able to make an upload of one local file into the server.

0

7.3.2 Save As

Usage Example

```
type
SaveDialog1: TSaveDialog;
...
SaveDialog1.Title := 'Save As...';
SaveDialog1.Filter := '*.txt';
SaveDialog1.FileName := 'somefile.txt';
SaveDialog1.Execute;
```

This is how the dialog is shown on each platform:

Windows Platform

Q Save As		X
🕞 🔾 🗢 📜 🕨 Libraries 🕨	✓ 4→ Search Libraries	٩
Organize 🔻	₩7 ▼	0
	Documents Library Music Library Pictures Library Videos Library	
File <u>n</u> ame: somefile.bxt Save as <u>type</u> : *.bxt		•
Hide Folders	Save	

HTML5 Platform

CD)

Save File As	×
Filename	somefile.txt
	OK Cancel

In order to save a file from the remote machine Thinfinity® VirtualUI™ for FireMonkey® will do a download into the local machine.
8 Appendix B - Tailoring the interface

8.1 Customizing the Web Interface

Thinfinity $\ensuremath{\mathbb{R}}$ Virtual UITM for FireMonkey $\ensuremath{\mathbb{R}}$ allows you to modify the web interface and tailor it to your branding scheme.

<u>Customizing the application logo</u> and other image files can be very simple, once it only requires you to have the new image file and tell the application where it is located.

<u>Customizing the structure and style</u> of the application may be a little bit more complex. These kind of customizations have to be done at a programming level (HTML and CSS).

Read also how to protect the customized web files in the Files Location topic.

8.1.1 Changing the logo

Modifying the application logo can be as simple as copying the new logo image and telling Thinfinity® VirtualUI^m for FireMonkey® application where it is located:

1. Create a folder called "BrandingFiles", if it doesn't exist yet, under the folder webfmx located inside the Thinfinity® VirtualUI™ for FireMonkey® installation directory.

(e.g.: C:/Program Files/Thinfinity® VirtualUI™ for FireMonkey®/webfmx)

- 2. Copy your own logo image file to the "BrandingFiles" folder.
- 3. Create the WebAliases.ini file and configure it:

a. Create a file called "WebAliases.ini" in the installation directory (e.g.: C:/ Program Files/Thinfinity® VirtualUI[™] for FireMonkey®/WebAliases.ini). If the file already exists, only append the lines to it.

b. Configure the redirection of the logo files you want to substitute, following the two examples below (webFMX.png.png and favicon.ico):

;=======				
Main log	>			
;=======				
/images/w	ebFMX.png.png=	BrandingFile	es\MyLogo.png	
;=======				
;Favicon				

c. Save it.

4. Open the application to see the changes.

Take into account:

a. Any line in the "WebAliases.ini" file starting with a semicolon will not be considered by the application. It can be used to leave comments in the file.

b. You can substitute any interface image or file, by following the same steps described above.

c. Sometimes the favicon is not shown right the way, because the browser keeps history of the images. In that case, you should clean the browser cache before trying out the changes.

8.1.2 Customizing the web files

To customize the web files, you should:

1. Create a folder called "BrandingFiles", if it doesn't exist yet, under the folder webfmx located inside the Thinfinity® VirtualUI™ for FireMonkey® installation directory. (e.g.: C:/Program Files/Thinfinity® VirtualUI™ for FireMonkey®/webfmx)

2. Make copies of the original web files that you want to modify to the "BrandingFiles" folder. Copy only the files to be modified without their associated folder structure.

- 3. Customize the files (html, css, etc) as you prefer.
- 4. Create the WebAliases.ini file and configure it:

a. Create a file called "WebAliases.ini" in the installation directory (e.g.: C:/ Program Files/Thinfinity® VirtualUI™ for FireMonkey®/WebAliases.ini). If the file already exists, only append the lines to it.

b. Configure the redirection to the files you have modified, by adding a line similar to the examples below for each modified file:

[Alias]

/index.html=BrandingFiles\my_index.html
/css/index.css=BrandingFiles\my_index.css

c. Save it.

5. Open the application and check out the changes.

Take into account:

a. Any line in the "WebAliases.ini" file that starts with a semicolon will not be considered by the application. It can be used to leave comments.

b. The paths located in the HTML, CSS, and other contents will be kept relative to the original file location. This means that you won't have to change the content paths when customizing this files.

8.1.3 Files Location

We recommend that a new folder be created in order to keep the customized files instead of having them with the original files. This will enable you to:

- a) Get back to the original interface configuration at any time.
- b) Make sure that your files will be safe after a version upgrade.

You can also choose to place the files inside or outside the webroot structure. Keep reading to see how each option will behave:

Storing the customized files in the webroot directory:

In this case:

1) The files will be externally accessible from a URL similar to: https://127.0.0.1/ BrandingFiles/customizedFile.html

2) The file paths, indicated in the "WebAliases.ini", can be relative to the webroot directory. (e.g. "/img/webFMX.png.png=BrandingFiles\MyLogo.png"). You will find other relative path examples on the topics <u>Changing the logo</u> and <u>Customizing the web files</u>.

Storing the customized files outside the webroot directory:

In that case:

1) The files will be protected, because it won't be possible to access the customized files from a URL.

2) The file paths, indicated in the "WebAliases.ini", must be absolute, as in the example below:

[Alias]

/index.html=c:/BrandingFiles/my_index.html
/images/webFMX.png.png=c:/BrandingFiles/MyLogo.png

9 Appendix C - JavaScript API

Thinfinity® VirtualUI[™] for FireMonkey® JavaScript API enables you to embed FireMonkey applications into pre-existing Web environments.

My Website ×	
← → C □ http://mywebsite.com	=
W Website	
Applications: TMS NavBar for FireMonkey	 TMS Navbar for FireMonkey TMS Navbar for FireMonkey TMS Navbar for FireMonkey File types Word documents Excel documents Accos files Accobat files Vord documents Excel documents Excel documents Acrobat files Pictures Documents Calendar Search

In order to integrate Thinfinity® VirtualUI[™] for FireMonkey® into your web page you will be required to modify the HTML page by adding some Javascript code. From this point on, we consider you already have installed and configured Thinfinity® VirtualUI[™] for FireMonkey®. If you haven't, go back to the <u>Getting Started</u> topic.

To learn how to use the SDK library, read the following topics:

- Deploying Modifying the HTML file Connect method Authentication Scheme SSL Certificate
 - Take a look also on the sdk.html file available in the Thinfinity® VirtualUI™ for FireMonkey® server installation directory, under the 'webfmx' folder. After configuring the profileKey parameter on the connect method, you can try it out from the browser through the address http(s)://server_IP:port/sdk.html.

9.1 Deploying

These are the files that should be deployed within your application/website, when using the Thinfinity $\$ VirtualUI^M for FireMonkey $\$ SDK.

All the files can be found inside the application directory under the Thinfinity® VirtualUI™ for FireMonkey® folder.

- 1. The *sdk.min.js* library
- 2. The *webfmx.ui.css* and the *popups.css*
- 3. The whole *css.m* directory. These are the styles for mobile devices.
- 4. The whole *images/core* directory.
- The images and the mobile stylesheets (items 3 and 4 above) must be placed in the same subdirectory tree relative to sdk.min.js location.

9.2 Modifying the HTML file

You need a remote application container in your web page. This can be either:

- A div element
- An iframe element
- A new browser window

You will be able to configure this through the <u>connection mode</u> (step 6b explained further below).

Modifying your html file, step-by-step:

- 1. Open the HTML page for editing.
- 2. Add these meta tags into the <head> tag:

```
<meta http-equiv='Content-Type' content='text/html; charset=utf-8' />
<meta http-equiv='X-UA-Compatible' content='chrome=1'/>
```

3. If you want the Thinfinity® VirtualUI^M for FireMonkey® integration to work with iOS, add the following <meta> tags into the <head> tag.

```
<link rel='apple-touch-icon' href='images/icon.png'/>
<meta name='apple-mobile-web-app-capable' content='yes' />
<meta name='viewport' content='width=device-width, initial-scale=1.0,
maximum-scale=1.0, minimum-scale=1.0, user-scalable=no, target-
densityDpi=device-dpi'/>
```

4. Add a reference to the css stylesheet files into the <head> tag. These files must be $\frac{deployed}{deployed}$ with your website/application.

<link rel='stylesheet' type='text/css' href='css/popups.css'/>
<link rel='stylesheet' type='text/css' href='css/webfmx.ui.css'/>

5. Add the following libraries inside the <head> tag:

a. The jQuery library (jquery.min.js):

```
<script src='https://ajax.googleapis.com/ajax/libs/jquery/1.6.1/
jquery.min.js' type='text/javascript'></script>
```

b. Point a script tag to the Thinfinity® VirtualUI^M for FireMonkey® SDK client library (sdk.min.js): this file will have to be deployed with your website/application. The tag below should be added to the <head>section, too.

```
<script src='sdk.min.js' type='text/javascript'></script>
```

6. Also inside the <head> tag, add one more <script> tag. The *GetWebFMX* method creates the object that handles the Thinfinity® VirtualUI[™] for FireMonkey® SDK functionality. It has two arguments: the Thinfinity® VirtualUI[™] for FireMonkey® server URL and the connection mode in which Thinfinity® VirtualUI[™] for FireMonkey® SDK will work. The *connect* method is the method that creates the application and positions it on the structure you have configured (div, iFrame, Window).

a. Substitute the 'Thinfinity® VirtualUI[™] for FireMonkey® server URL' argument, that goes inside the *GetWebFMX* method, with the Thinfinity® VirtualUI[™] for FireMonkey® protocol + IP + Port following this format example <u>https://127.0.0.1:8443</u>.

b. Substitute the second argument with the mode you want the connection to be established:

Mode	How it works
Local (remote =false)	The application is embedded in the same page inside a div structure.
Remote (remote=true)	The sdk.min.js posts into Thinfinity® VirtualUI™ for FireMonkey® Server. With this mode you can place the application inside an iFrame or a new window tab.

c. Find out the next sub-topic ('<u>Connect method</u>') how you should complete the arguments that go within the connect method.

6. Code special behaviours on the available Thinfinity® VirtualUI™ for FireMonkey® SDK events.

7. Use the <u>Authentication Scheme</u> to ensure the usernames and passwords security.

9.3 Connect method

The 'connect' method creates the application and places it on the specified html structure. In order to do so, it expects a JSON object as argument in which you can inform all the desired settings. If you want to understand exactly how each setting will influence the connection, read the following topics:

Placement parameters Application parameters Settings parameters Event parameters

Right bellow, you will find the connect method with all the possible parameters set. They should not be sent all together, because each mode and environment will require a different JSON object setup.

- The <u>Placement parameters</u> will be required depending on the connection mode (remote or local).
- The <u>Application parameters</u> will configure which application and the authentication information generated previously.
- The other parameters (<u>Settings</u> and <u>Events</u>) are optional and should be sent whenever you need to change a particular Thinfinity® VirtualUI[™] for FireMonkey® behavior.

```
webfmx.connect({
        // Placement
        targetWindow: 'substitue with the iframe id or window name',
        exitURL :
                      'about:blank',
                      'connection.html',
        postpage:
        divId :
                      'webfmx',
        // Application
        profileKey: 'substitute with the application Key',
        profilePass: 'substitute with the generated password',
        // Settings
        resolution:
                         'fittobrowser',
        width:
                         $(window).width(),
        height:
                         $(window).height(),
        maxWidth:
                         0,
        maxHeight:
                         0,
        showToolbar:
                         false,
        scaled:
                         false,
        clipboard:
                         true,
        showToolbar:
                         true,
        fitToBrowser:
                         true,
        // Events
        events: {
                onServerConnecting
                                             : function (reconnecting) { },
                onQueryDisconnect
onServerConnect
                                            : function () { },
                                            : function () { },
                onSessionStart
                                            : function () { },
                onServerConnectionError : function (errMessage) { },
    function () { }
                onServerDisconnect
                                             : function () { }
        }
});
```

If you are using the SDK <u>Authentication Scheme</u>, you should call the <u>IsOneTimeKeyValid</u> method before connecting. This method will validate the authentication key and password and open a new client session.

9.3.1 Placement

Find below all the parameters related to the application placement. Some of the parameters should be sent only when the connection mode is set to Remote and some of them should be sent only when the connection mode is Local.

Paramotor	What it means	Tupo/format	Dofault	send when mode	
Farameter	What it means	турелогнат	Derault	remote	loca I
targetWindow	Inform '_self' to have the connection opened over the current window. The '*' value will open a new window with a name assigned by Thinfinity® VirtualUI [™] for FireMonkey®. If you inform an existing window name or iframe id, Thinfinity® VirtualUI [™] for FireMonkey® will position the connection on this target and if the target does not exist, a new window will be created with that name.	string '*', '_self', target window (iframe id or window name)	'_self'	yes	no
exitURL	Assign a URL to redirect after the connection has closed.	<u>string</u> URL	'about:blank'	yes	no
postpage	This parameter configures the server HTML file. The embedded file name is 'connection.html'. You only have to change this value in case you have customized this file.	<u>string</u> html file name	'connection. html'	yes	no
divId	div id where the remote desktop will be placed, when using local mode.	<u>string</u> div id	'webfmx'	no	yes

9.3.2 Application

These are the parameters related to the application.

Parameter	What it means	Type/format
profileKey	Key that identifies the application to be started. You will find the key information by <u>editing the</u> <u>application</u> on the Thinfinity® VirtualUI™ for FireMonkey® Server Manager Application tab.	<u>string</u> profile key
profilePass	Generated one-time password, used to validate the user from the client side.	<u>string</u> password

9.3.3 Settings

Find below all the settings that can be configured through Thinfinity® VirtualUI™ for FireMonkey® SDK <u>connect method</u>.

	-		
Parameter	What it means	Type/ format	Default
resolution	'fittobrowser', 'fittoscreen', 'fixed', when fixed, the parameters width and height will be considered.	<u>string</u> resolutio n	'fittobrowse r'
width	Application environment width. It will only be considered when the resolution parameter is set to 'fixed'.	<u>integer</u> pixels	\$('#deskdiv ').width()
height	Application environment height. It will only be considered when the resolution parameter is set to 'fixed'.	<u>integer</u> pixels	\$('#deskdiv ').height()
maxWidth	Maximum width for the application environment. Only available when the setting fitToBrowser below is enabled.	<u>integer</u> pixels	0
maxHeight	Maximum height for the application environment. Only available when the setting fitToBrowser below is enabled.	<u>integer</u> pixels	0
showToolbar	Set to false to hide Thinfinity® VirtualUI™ for FireMonkey® toolbar.	<u>boolea</u> <u>n</u> true, false	true
scaled	By setting this option to true, the connection image will be scaled. The original desktop size will be the maximum limit size applied to the connection. It works only when the fitToBrowser property is enabled.	<u>boolea</u> <u>n</u> true, false	false
clipboard	Enables/disables the application clipboard.	<u>boolea</u> <u>n</u> true, false	true
fitToBrowser	Set this property to true in order to have the application div adjusted to the web browser size. If this property is set to false, you will have to manage manually the div location and size.	<u>boolea</u> <u>n</u> true, false	true

9.3.4 Events

These are the events that can be handled from the Thinfinity $\ensuremath{\mathbb{R}}$ VirtualUI^ for FireMonkey $\ensuremath{\mathbb{R}}$ SDK.

Event	Parameters	When it is triggered
onServerConnecting	reconnecting	This event is fired during the server connection establishment. The reconnecting argument informs whether this is a reconnection or a first-time connection.
onQueryDisconnect	-	Anytime the Web client is about to be disconnected, the 'onQueryDisconnect' will be triggered. It is intended to validate with the user if the disconnection is desired.
onServerConnect	-	The 'onServerConnect' event is fired every time a 'connect' command is exchanged between the browser and the Thinfinity® VirtualUI™ for FireMonkey® Server. It is a way of making sure the server received a sent 'connect' command.
onSessionStart	-	This event will be fired when the client session has been started on Thinfinity® VirtualUI™ for FireMonkey® Server.
onServerConnectionError	errMessage	If an error prevents the client connection to be established, this event will be fired. The errMessage argument brings the error message.
onServerDisconnect	-	Anytime the Web client gets disconnected from the Thinfinity [®] VirtualUI™ for FireMonkey [®] server, the 'onServerDisconnect' will be fired. It could be triggered because the connection was lost incidentally or also because the user disconnected from the server on purpose.

9.4 Authentication Scheme

This SDK is intended to embed a FireMonkey application within an existing website/ application.

In this multi-application context, the authentication process involves two steps that were designed to ensure the security of the exchanged data among the different applications components:

<u>Generating an authentication key</u> from the website/application server side
 <u>Validating this key</u> from the application client side, before starting the

FireMonkey application (connect method).

9.4.1 Generating the key

The one-time authentication key is a temporary key generated by Thinfinity® VirtualUI[™] for FireMonkey® Server, intended to protect the actual username and password. Both key and password are temporary data and they will be only valid for a single connection and limited period of time.

How it works:

1. First you need to ask Thinfinity® VirtualUI[™] for FireMonkey® Server to generate the key and password for you. Call the server following this URL format:

http(s)://ThinfinityVirtualUIforFireMonkeyServer:Port/ws/oturl/
get?<queryString>

2. The queryString should be built with all parameters listed below:

username= <username> &password= <password> &plen= <passlen>
 &expires= <expires>

Find on the table below a description for each required parameter.

Parameter	Description
username	This is the username to be authenticated on Thinfinity® VirtualUI™ for FireMonkey® Server.
password	The password of the user to be authenticated.
plen	This parameter carries the returned unique password length.
expires	Through this parameter you can set an expiration (in minutes) for the key-password pair. 'Expires = 30 means' that the pair won't work anymore after 30 minutes have passed from the pair generation.

3. If Thinfinity® VirtualUI[™] for FireMonkey® gets to authenticate with the sent parameters, it will return a JSON object containing the One-Time key/password pair.

Parameter	Description	
valid	Use this result to know whether the authentication was successful (username and password were valid).	
key	This is the one-time key to be used for the client side authentication.	

D 255	This is the password to be used for the client	
pass	side authentication.	

4. If the authentication was successful, write on the end HTML file the generated key and password information, so that they can be used for the client-side <u>key/password Validation</u>.

JavaScript example:

This is a JavaScript example. The actual *GetOneTimeKey* method should be translated to the Server side programming language and only invoked there to avoid username/password exposure on the client side.

```
function GetOneTimeKey(username,password) {
    var otkey = getOneTimeKey(username, password);
    if (!otkey.valid) {
      alert('Invalid username/password');
    }
    return otkey;
}
function getOneTimeKey (username, password, passlen, expires) {
    var returl = '';
    if (!passlen) passlen = 8;
    if (!expires) expires = 30;
    $.ajax({
        url: 'http(s)://ThinfinityVirtualUIforFireMonkeyServer:
port' + '/ws/oturl/get?username=' + username + '&password=' +
password + '&plen=' + passlen + '&expires=' + expires,
        async: false,
        dataType: 'html',
        statusCode: {
            200: function (data) {
                returl = eval('('+data+')');
            }
        }
    });
    return returl;
}
```

9.4.2 Validating the key

After you have generated the one-time key and password on the server side and have written them on the HTML file, you should call the IsOnTimeKeyValid method from the client-side. This method checks whether these authentication credentials are valid and opens a new Web client session, using Ajax.

After invoking this method, you will be able to call the <u>Connect method</u>, responsible to create and place the FireMonkey application on the HTML container.

JavaScript example:

```
function ValidateOneTimeKey(key, pass) {
    webfmx.isOneTimeKeyValid(
        key,
        pass,
        function () {
            connect();
        },
        function () {
            alert('error');
        }
    );
}
```

Parameters:

Parameter	Description	Туре
key	one-time generated key	String
pass	one-time generated password.	String
success	function to be executed in case the authentication info is validated.	functi on
error	function to be executed in case the authentication info is not valid.	functi on

Read also:

Read also the <u>connect method</u>, called in case of the validation success.

9.5 SSL Certificate

When you embed Thinfinity® VirtualUI^M for FireMonkey® into a website and the browser can' verify the configured certificate authenticity, your integration will not work.

There are two ways of handling this issue:

1. Using your own certificate

If you already have your own certificate or if you will get one from a Certificate Authority (CA) , the only thing you will have to do is configure the certificate as described on 'A CA Certificate' section.

2. Using the HTTP protocol

Otherwise, you should configure the Thinfinity® VirtualUI[™] for FireMonkey® protocol to HTTP. This setting is available on the <u>Thinfinity® VirtualUI[™] for</u> <u>FireMonkey® Manager General tab</u>.

Keep in mind you will have to change the protocol on the <u>GetWebFMX server parameter</u> as well.
